# Active Web HW #1
Modify an Active Web Form

Now that you have a functioning and well-presented website, you will create a web page to edit the data that you input into the database. You will create an "edit form" with the same formatting as the input form. (*Extend ICE1 to accomplish this task*)

- Copy the contents of your ICE1 folder into your HW1 folder once you have completed ICE1.
- Working in the HW1 folder, add an additional page to your website by copying the **default.aspx** page and rename it to **edit.aspx.**
- Change the page Title to "Army-Navy BBQ Edit Form".
- Change the default mode of the FormView control to **Edit.**
- Edit the **EditItem** template to improve the presentation of the form by:
  o Making all the field names human readable
  o Adjusting the Columns and MaxLength property as needed for each field
- Click on the FormView control and check the box for Enable Paging
- Add additional hyperlinks as needed to link all pages of your site together

The report edit form page should now look similar to this:

Publish the updated .aspx to your cadet web page. This page should be accessible via the URL:
http://it305cadet/cadet/x#####/AW/HW1/edit.aspx.
